

Xenia Innovation Center

Xenia specialised in the development, production and sales of advanced thermoplastic composites, increases its position in the market with the announcement of its own internal research and innovation center for thermoplastic composites.

“Its fundamental for us to enhance our expertise and invest in our Innovation Center, starting from human resources right through to the technology department. Only with this we can increase our contribution in terms of know-how and support to our clients” said Fabio Azzolin, President of Xenia.

Reducing the impact on the environment, cost and increasing performance features are common objectives shared by all manufacturing departments within the various industrial markets that Xenia is involved in.

Internally at Xenia Innovation Centre, a team of multi-skilled experts active in the fields of Chemistry, Mechanics and Design works in synergy with clients in the realisation of each product. Co-design, Simulation, Prototype, Manufacturing process and Testing are the five fundamental phases followed which contribute to the reduction of time-to-market, cost of development and possibility of errors during the entire development of the new project.
